

Remote video security solutions

Dissuade.
Detect.
Delay.
Take action.

Today, technology allows us to develop traditional video surveillance into a less passive system: by combining it with immediate action, such as remote questioning, we can avoid simple incidents escalating into problematic events.

Protectas offers you the best possible combination of technical and human resources for an optimised, cost-effective security solution tailored to your needs. This brochure explains how, detailing our approach, which is unique on the market.

"Security is being transformed into an ecosystem of connected objects and human intelligence."

- Jonas Bergström, head of RVS, Europe

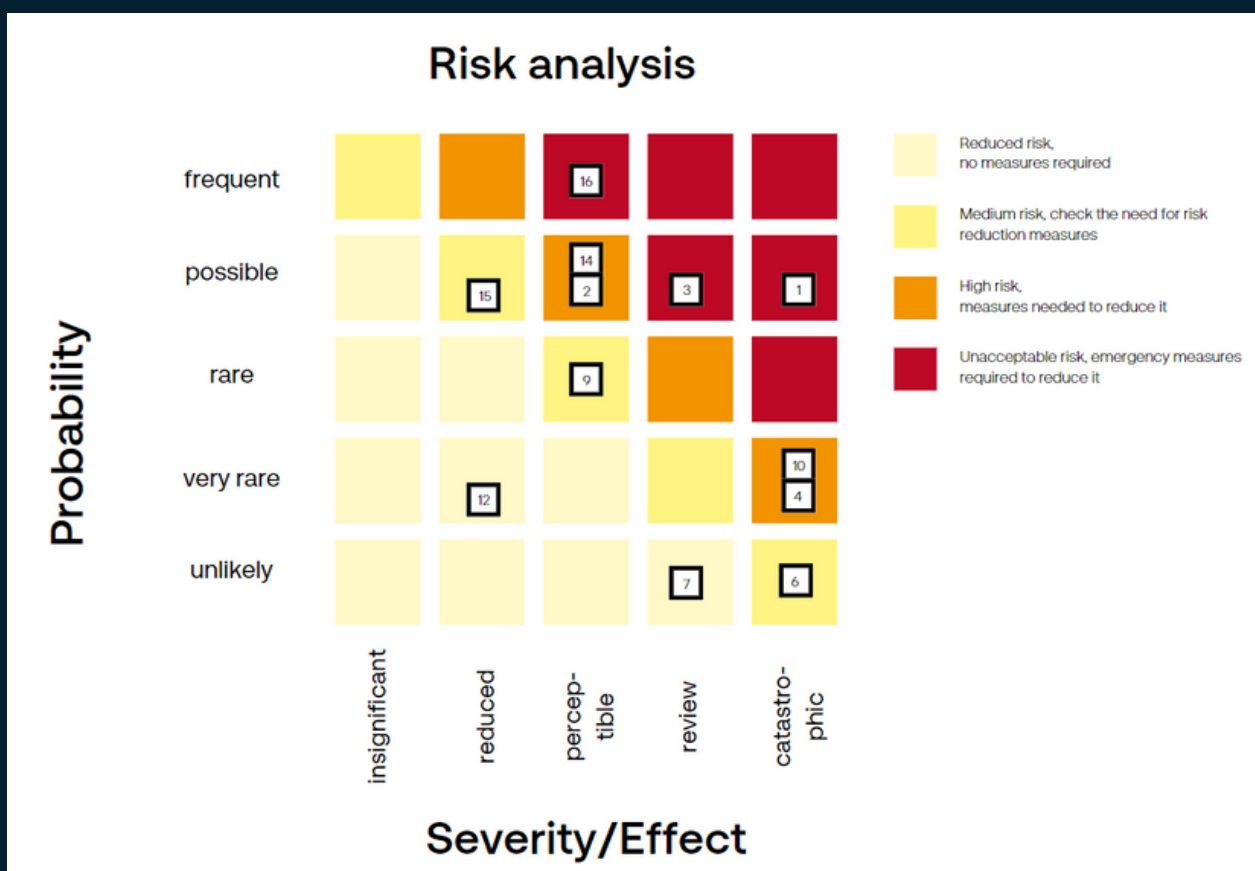

Infrared night vision

1-Diagnostic visit: risk analysis

Identify and prioritise your site's risks so that we can offer you appropriate solutions to reduce your exposure.

Definition of requirements through risk analysis

- Identifying the risk and how it may occur
- Risk analysis based on the probability of occurrence and its severity
- Identifying and studying vulnerabilities
- Assessing the risk level and prioritising treatment

2-Concept proposal

The concept makes video coverage and/or the anti-intrusion system more visual. Strategically placed equipment gives operators the resources they need to carry out effective video surveillance. These may be detectors such as radar or thermal cameras, as well as fixed or mobile optical cameras. You can use the loudspeakers to challenge intruders from a distance. Of course, we can connect existing equipment.

3-Choice of services and technologies

Existing or new cameras and sensors are linked to our Security Operation Center* (SOC).

Potential threats are detected via cameras and automatically analysed according to preset criteria.

If an alert is received, the threat is immediately dealt with by an SOC operator, via cameras or loudspeakers.

Security agents ready to respond to instructions from the SOC. If necessary, the police are called in.

Detailed report of all incidents compiled and provided to the customer on the dedicated interface.

The best possible combination of security products and services for a proactive security solution

*What is the SOC?

Faultless security thanks to professional alarm management

Protectas guarantees a rapid response if an alarm is triggered. This is provided by two SOC's in Geneva and Zurich with qualified staff who will take action based on an intervention plan agreed with the customer.

Our operators, who work 24/7, manage more than 3,000 video feeds every day and answer calls in French, German, Italian and English

Additional services offered by the SOC

We use the latest technology, so that our operators can assess a situation live and act remotely, as if they were on site.

- **Remote alarm verification**

As soon as an alarm is received, loudspeakers and powerful spotlights interact with any person known to be on site to warn people off if necessary.

- **Area protection and surveillance**

Intelligent video analysis functions scan the behaviour of individuals, vehicles and objects. Any unusual activity triggers an alarm that is 99.9% reliable, which the operator deals with immediately.

- **Remote video rounds**

Random video rounds are conducted remotely at the most sensitive times. Our operators can monitor a vast area and an entire site more quickly than an agent on site.

- **Remote bodyguards**

On request, our operators can support your staff for the most sensitive times and actions.

- **Remote access and exit management**

Our operators conduct visual checks and remote identification to trigger the opening and closing of gates and other security barriers.

- **Business intelligence**

Using video data (number of visitors, time of day, areas frequented in real time, etc.) helps to improve your customers' experience and creates synergies with other areas of your business, such as marketing.

4-Installation and maintenance

The selection and installation of appropriate, high-performance equipment is of crucial importance. Throughout the process, we carefully identify the equipment best suited to your specific situation in terms of your business, environment and needs.

Reminder

- Our security solutions are always offered as a service, with a monthly fee.
 - In contrast to this, product per project pricing reduces technical efficiency: once the project is up and running, it becomes difficult to maintain, and extending the system becomes very expensive.
- Our concepts involve a human service
 - On-site surveillance, rounds/patrols or remote surveillance, alarm response
- Customers do not need to invest in new technology or have in-house skills as everything is included in our service offering.
- It's an attractive scenario for companies wishing to keep their capital intact and forgo capital investment (CapEx) in favour of operational investment (OpEx).
 - This way, safety is managed on the basis of operational cost planning (OpEx). Protectas provides a reliable and comprehensive security solution.
- Protectas takes responsibility for all the technical hardware installed.
 - This includes system integration, maintenance and operation.
- Cybersecurity included.

3 formulas for a tailored solution

VIEW	GO	PRO
Connection of existing equipment	Complete solution for small and medium-sized businesses	Full Managed By" solutions for total security management
Connection to our SOC	Combination of products and services	Integration on complex sites
Remote verification	Rapid deployment	3 levels of maintenance to choose from

See a different world.
